

# LineOfSight. How to make pseudo blackout

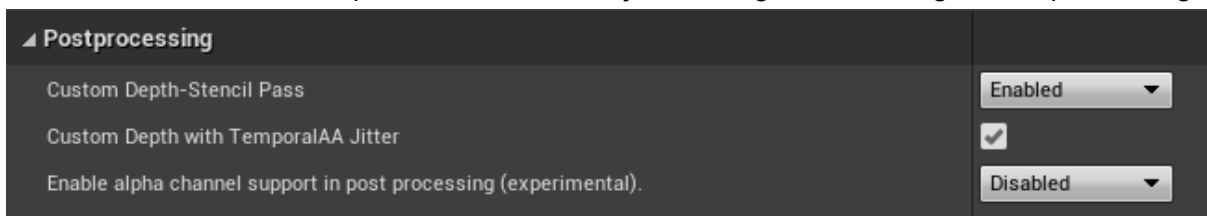

Video version: [Here](#)

Pseudo blackout.

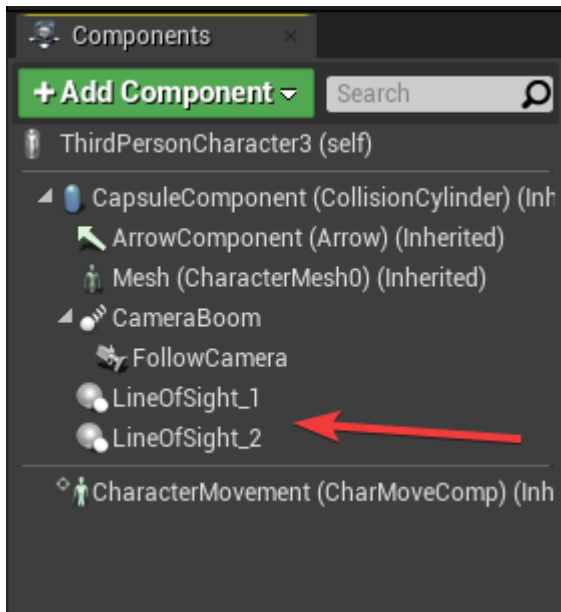

## Starting the tutorial

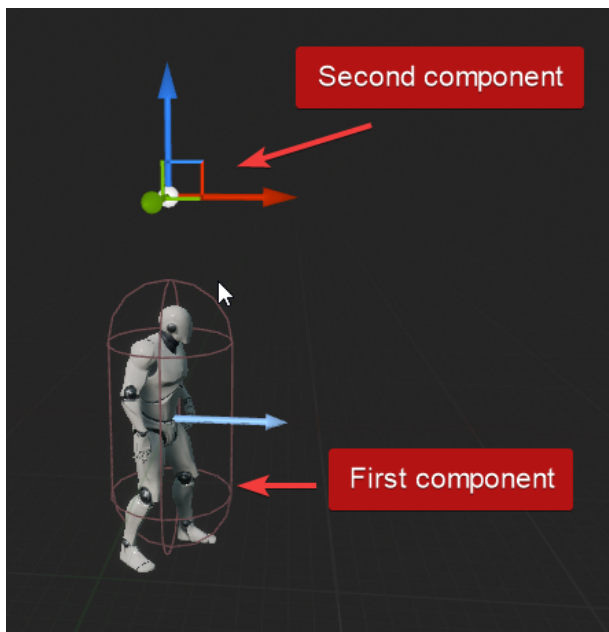

→ Turn on Custom Depth Stencil Pass. Project Setting -> Rendering -> Postprocessing

→ In character blueprint create two LineOfSight components

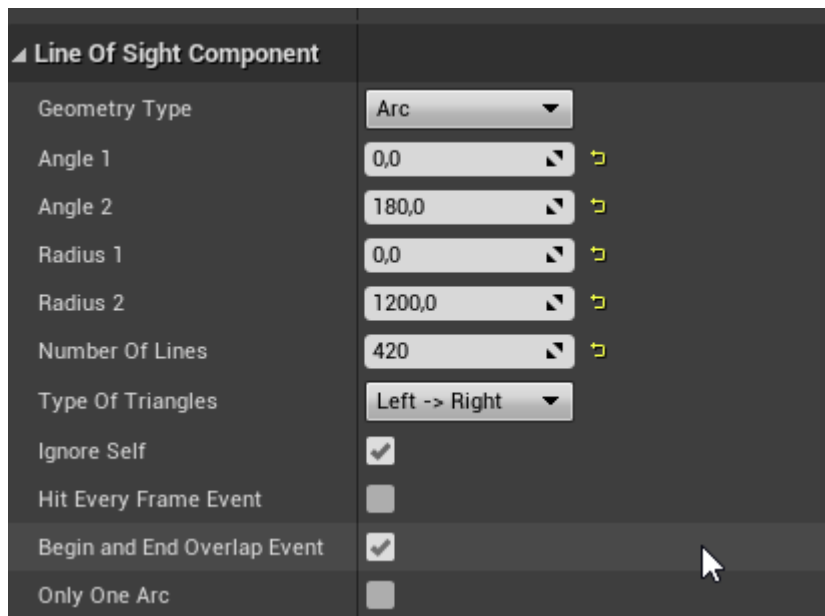

→ Place the second component above the character

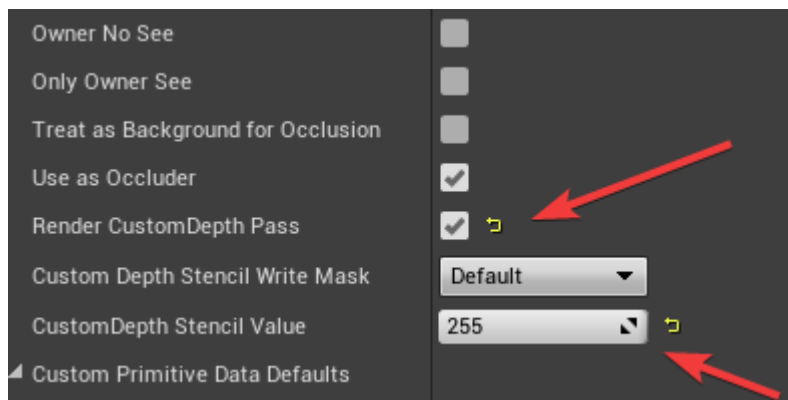

The first component for detecting enemies.

The second component is used in the Post Process for lightening.

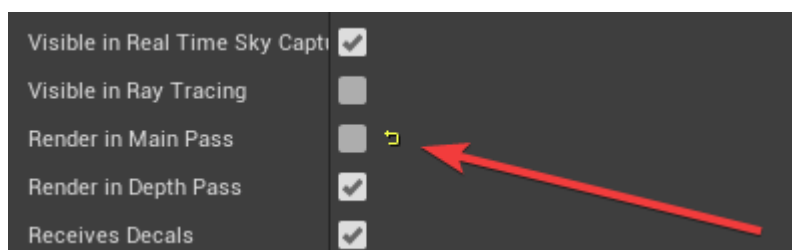

- Make the same settings for both components. For example set Angle 1 = 0, Angle 2 = 180, Radius 1 = 0, Radius 2 = 1200, Number Of Lines = 420
- We set it to 180 because the corners are calculated from the center of the mesh. 180 to the left and 180 to the right = 360.

- For the second component in the Rendering tab:
- ◆ Set Render Custom Depth Pass = true
  - ◆ Set Custom Depth Stencil Value = 255

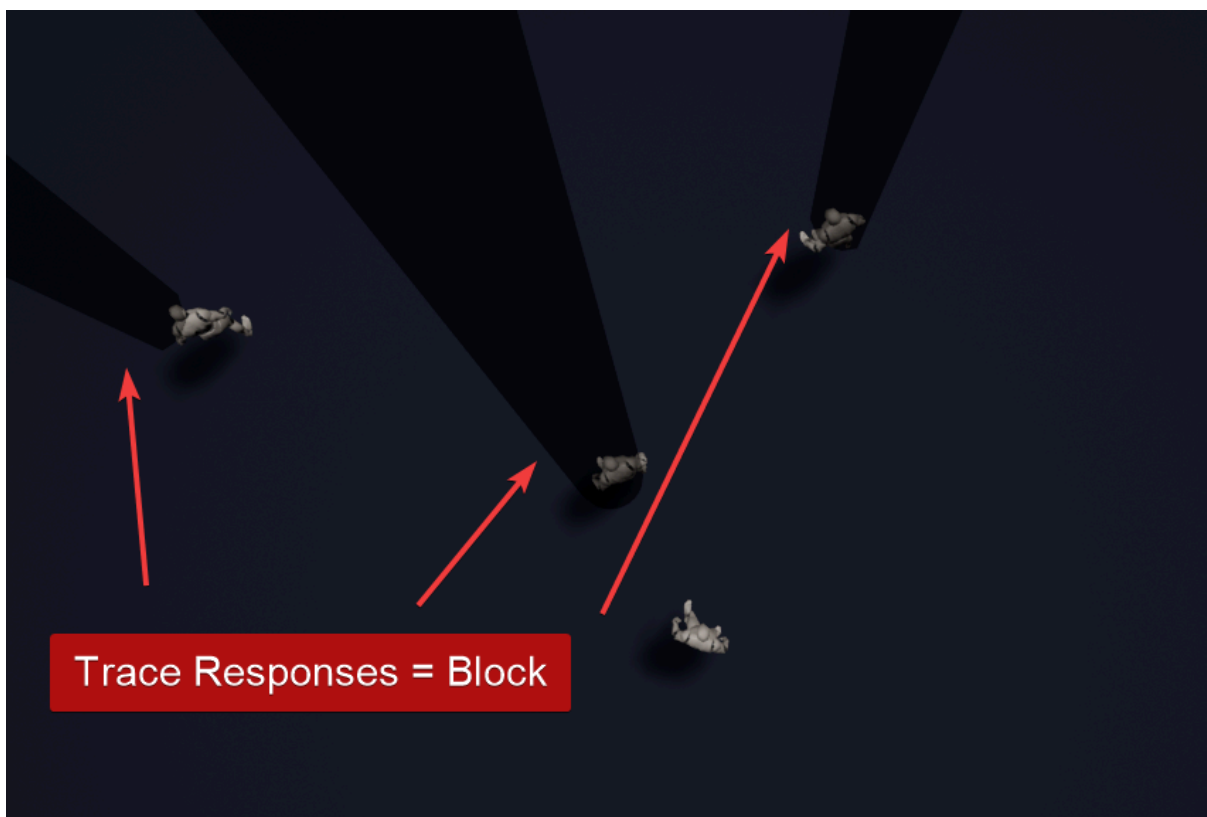

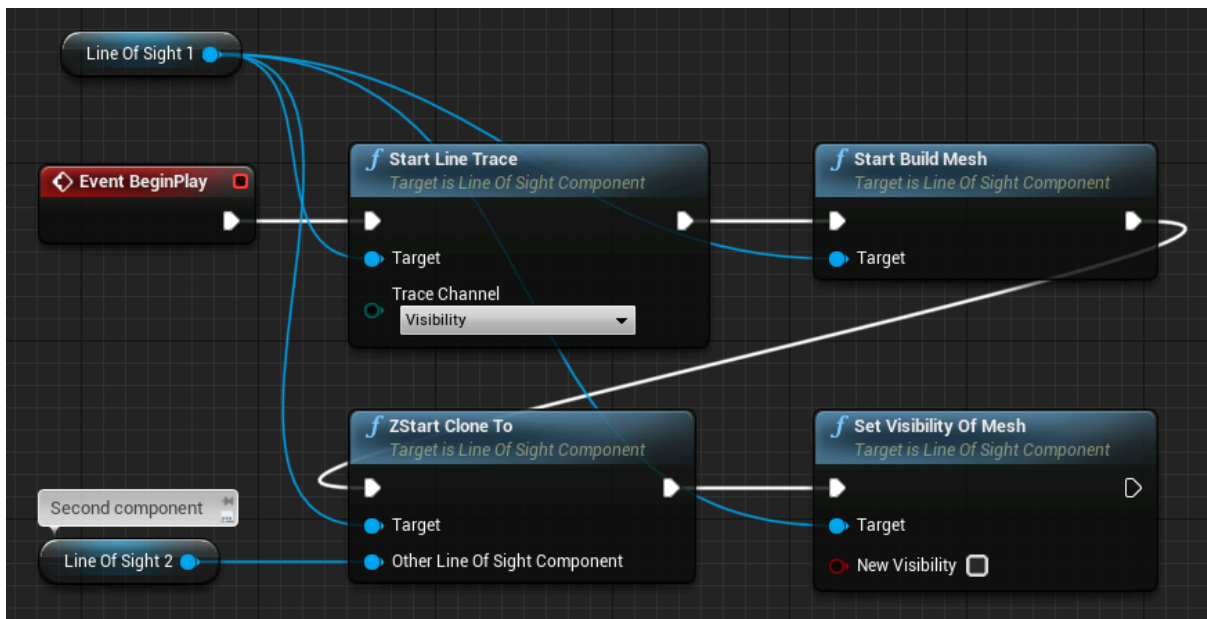

- For the second component in the Rendering tab:
- ◆ Disable Render In Main Pass

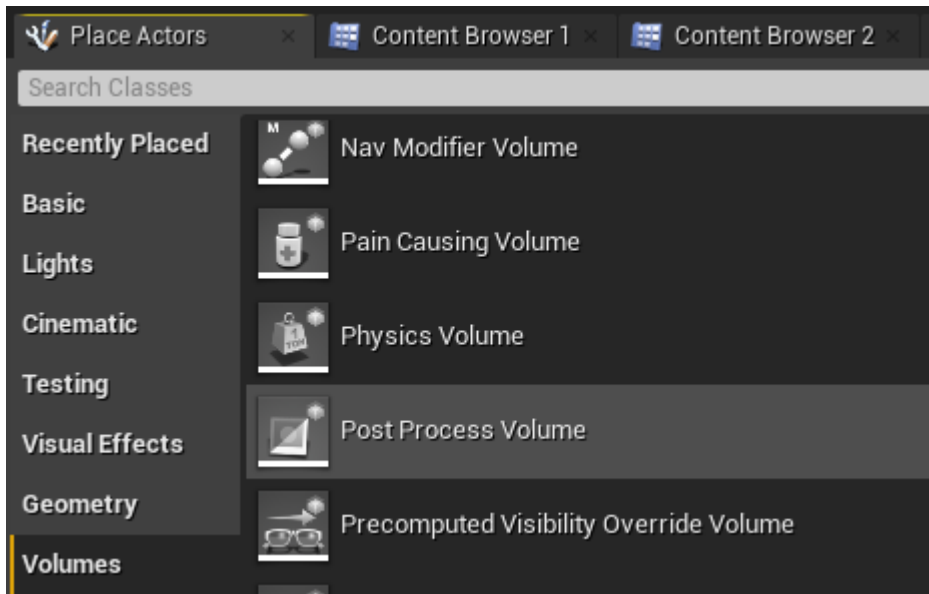

- In the Begin Play event, create: Start Line Trace -> Start Line Trace -> Start Build Mesh.

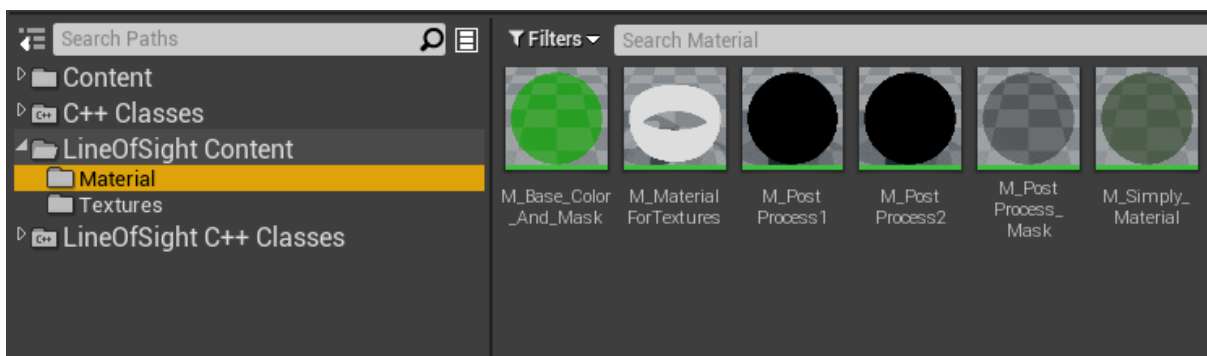

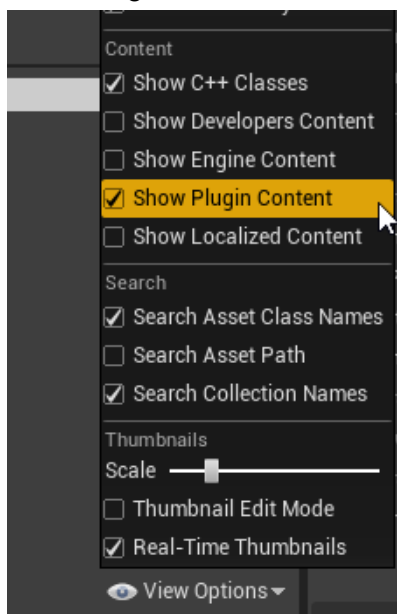

For the first component, we are not using the Start build Mesh function. This component only does tracing to detect enemies. If you want to see trace lines, enable the Debug option.

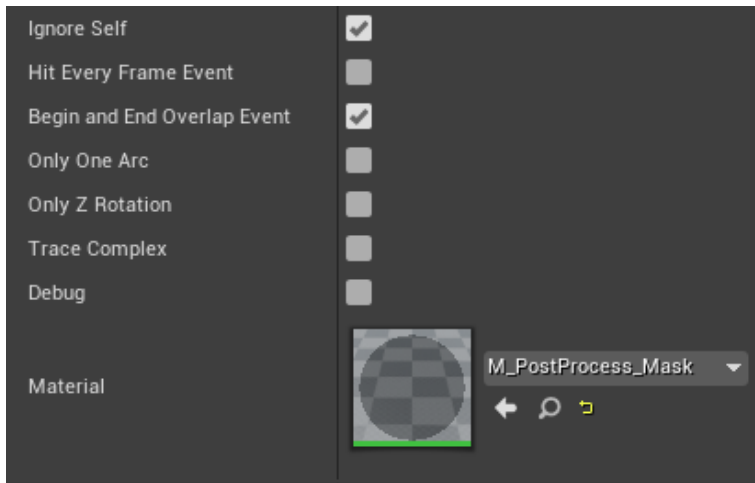

→ Place the Post Process Volume in the scene

- In the Post Process Volume settings, set the material **M\_PostProcess1** (LineOfSight Content Directory). If the LineOfSight Content directory is hidden click Show Plugin Content and Show Engine Content

- For the second LineOfSight component, set the material **MI\_PostProcess\_Mask1\_Inst** or **MI\_PostProcess\_Mask2\_Inst**

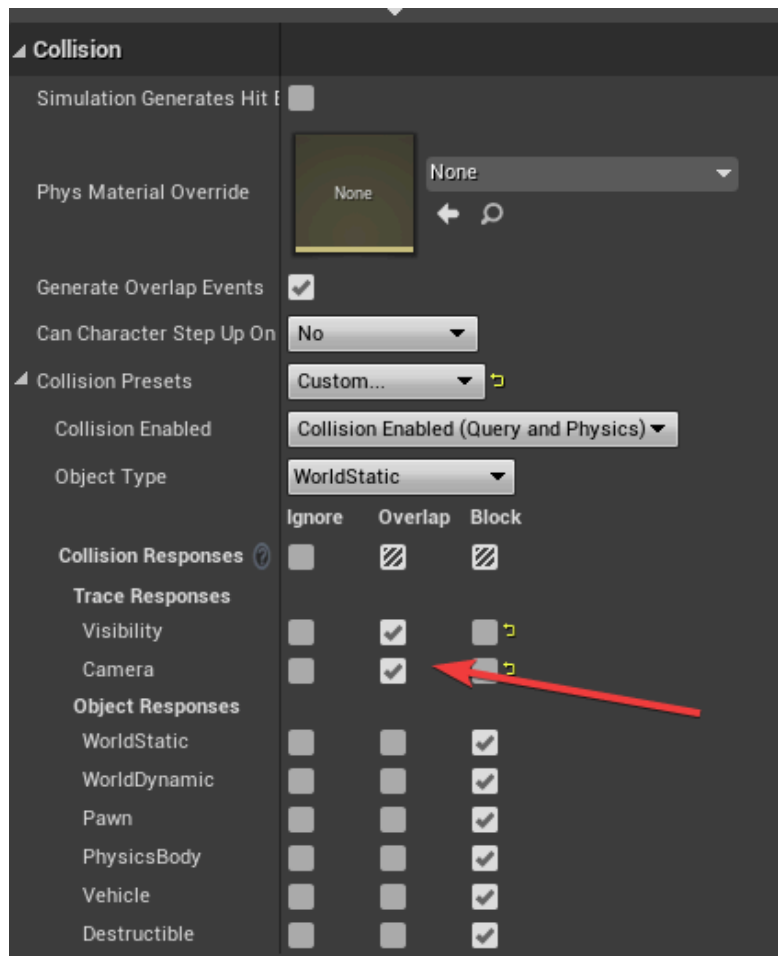

If you selected the material **MI\_PostProcess\_Mask2\_Inst** (instead of **MI\_PostProcess\_Mask1\_Inst**), then in the Rendering tab Disable Render In Depth Pass

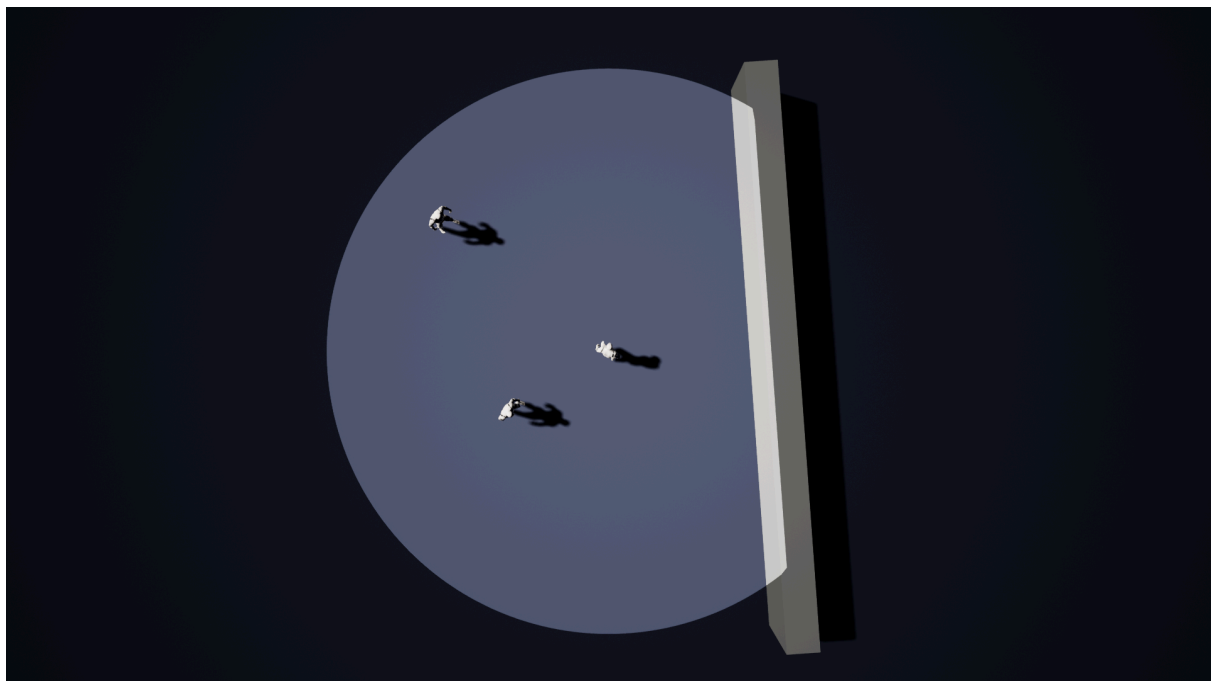

For the first LineOfSight component, no material is needed.

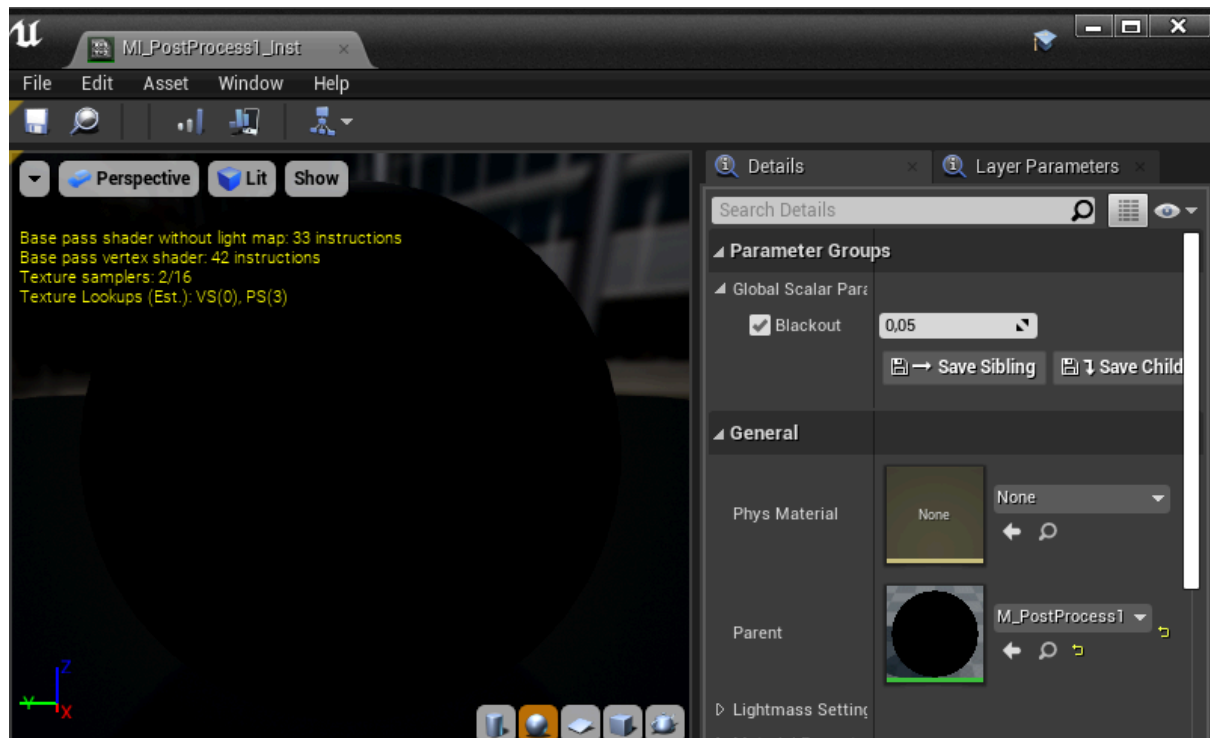

- Set Trace Responses = Overlap for the bot (enemy) character. It is for the bot (enemy), not your character.

Done. Launch the game, you will see a highlight under the mesh

The Blackout parameter adjusts the amount of black. Typical value 0.0 - 0.3.

The last thing to do is turn off the visibility of enemies outside the mesh.

→ Add Begin Overlap and End Overlap event for the first component
